Tue, 14 Aug 2018 06:06:00 GMT Following a general introduction we discuss how the motion of such a macroscopic quantum oscillator can be squeezed, and then show how the placement of a ferroelectric tip on the oscillator allows the coherent manipulation and control of the center-of-mass motion of ultracold polar molecules.

Since the collisional line broadening is proportional to the gas pressure, pressures below 10–3 Torr should be used to reduce the collisional broadening to the natural linewidth.
